

Connector training diagnostics — experimental

Recorded optimizer steps 1–500 (500 logged) | Cumulative examples consumed: 500 / 9,647 training records

Only the connector is trained. Loss is flow-matching MSE; sampling quality is not established.

A Optimization loss — stochastic timestep and noise

B Fixed-noise probes — matched captions, unchanged cohorts

C Caption-conditioning control — identical target, timestep and noise

At the last train probe, 32/32 examples had reached the optimizer. Validation examples never enter optimization.

Full-validation markers show the complete split. Fixed curves retain their original IDs/seeds.

Positive caption gaps favor matched captions; they do not establish image quality. Panels A and B use separate y-axis scales.
