

Connector + diffusion training diagnostics

Experimental | Optimizer steps 1-1,809 (1,809 logged)

Cumulative training exposures: 28,944 | Unique IDs in shown logs: 9,647

Selected training pool: 9,647 | Full training pool: 9,647

Connector and full diffusion transformer are trained. PRISM, VAE and native conditioner stay frozen.

A Optimization loss — stochastic timestep and noise

B Fixed cohorts — matched captions, RNG reset

C RNG-reset caption control — paired inputs unverified

At the last train probe, 32/32 examples had reached the optimizer. Validation examples never enter optimization.

Full-validation markers show the complete split. Fixed curves retain their original IDs/seeds.

Actual paired noise/timesteps are unverified. Caption gaps do not establish image quality.

Panels A and B use separate y-axis scales.
